

User-friendly, automated online distribution

Easily manage a strong online presence with a seamless connection

Hoteliers need to be where their guests are, and never has building a strong online presence been so crucial or complex as it is today. Guestline has partnered with Cubilis channel manager and IBE so hoteliers can automate their end-to-end online booking process via a 2-way interface across multiple channels, to have more bookings and more revenue with less administration.

The Challenge

Creating a strong online presence
with less administration

The Solution

Centralise online room bookings
and automate it within the PMS

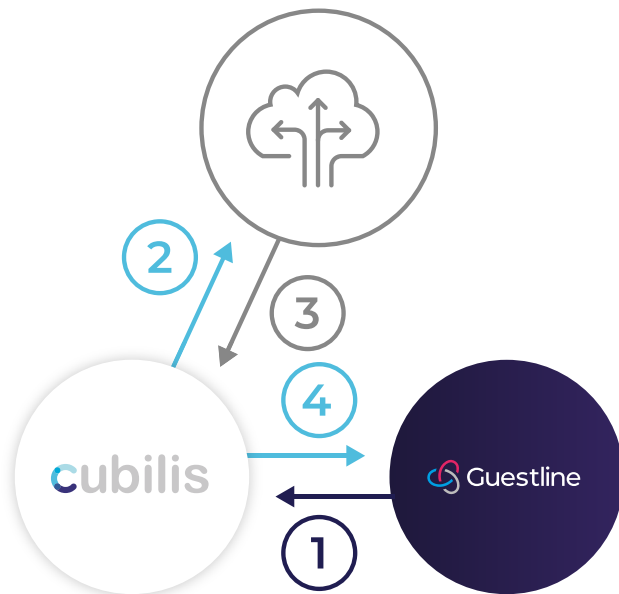

- **Increase online bookings**

For hotels to grow their business, it is important to connect with all booking sites first and then optimise prices and availability quickly and efficiently from a central control panel.

- **Save staff time**

Seamless connections between systems and a clear overview of all room prices and availability across all your booking sites are crucial to avoid double bookings between the PMS and OTAs, saving precious time and effort on reservation and channels administration.

How it works

- 1. Update**
Guestline Rezlynx PMS updates Cubilis room Availability, Rates and Restrictions (ARI) in real-time
- 2. Distribution**
Cubilis distributes ARI across its multiple online channels
- 3. Centralisation**
Cubilis centralises reservation details taken from the multiple online channels
- 4. Synchronisation**
Cubilis sends reservation details back to Guestline Rezlynx PMS
